Chuck Garner

The tangent line is a linear approximation $L(x)$ to a function $f(x)$ (also called the *linearization*).

Problem 1

Use a linear approximation to estimate $\sqrt{77}$.

Solution.

The tangent line to $f(x) = \sqrt{x}$ centered at $x = 81$ is

$$L(x) = f(81) + f'(81)(x - 81) = 9 + \frac{1}{2\sqrt{81}}(x - 81).$$

$$\text{Then } f(77) \approx L(77) = 9 + \frac{1}{18}(77 - 81) = 9 - \frac{2}{9} = 8\frac{7}{9}. \quad \square$$

Theorem 1 (Taylor's Theorem)

Let f be a function such that $f^{(k+1)}(x)$ exists for all x in the interval $(a - r, a + r)$. Then

$$P_k(x) = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \cdots + \frac{f^{(k)}(a)}{k!}(x-a)^k$$

is the k th degree Taylor polynomial of f at a , and

$$R_k(x) \leq \frac{|f^{(k+1)}(c)|}{(k+1)!} |x-a|^{k+1}$$

is the Lagrange form of the remainder, where c is a number between a and x which maximizes $f^{(k+1)}$. Moreover, assume f has derivatives of all orders. Then $f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{n!} (x-a)^n$ if and only if $R_k \rightarrow 0$ as $k \rightarrow \infty$.

Problem 4

Use the third-order Taylor polynomial for $f(x) = \ln x$ centered at $x = 1$ to approximate $\ln 1.06$.

Solution.

The Taylor polynomial is

$$P_3(x) = x - 1 - \frac{1}{2}(x - 1)^2 + \frac{1}{3}(x - 1)^3$$

so the approximation is

$$\begin{aligned} P_3(1.06) &= 0.06 - \frac{0.06^2}{2} + \frac{0.06^3}{3} \\ &= 0.06 - 0.0018 + 0.000072 = 0.058272. \quad \square \end{aligned}$$

This is the Lagrange form of the remainder:

$$R_k(x) \leq \frac{|f^{(k+1)}(c)|}{(k+1)!} |x - a|^{k+1}.$$

Note the remainder is the difference between the function $f(x)$ and the Taylor polynomial $P_k(x)$.

- ▶ This remainder is like the remainder for Alternating Series, in that it is the absolute value of the first unused term;
- ▶ Major difference: we maximize the numerator on the interval $[a, x]$ to get the largest bound.

Problem 5

Determine the error in using the third-order Taylor polynomial for $f(x) = \ln x$ centered at $x = 1$ to approximate $\ln 1.06$.

Solution.

The remainder is

$$R_3(x) \leq \frac{|f^{(4)}(c)|}{4!} |x - 1|^4.$$

The fourth derivative of $\ln x$ is $-6/x^4$ whose maximum value on the interval $[1, 1.06]$ is when $x = 1$; this leads to a numerator of -6 . So the error must be less than

$$R_3(1.06) \leq \frac{|-6|}{4!} |0.06|^4 = \frac{0.00001296}{4} = 0.00000324. \quad \square$$

From the geometric series $\sum x^n = \frac{1}{1-x}$, we may get – on the interval of convergence – power series for

- ▶ $\frac{1}{1-x^2}$ by replacing x^2 for x in $\frac{1}{1-x}$
- ▶ $\frac{1}{1+x}$ by replacing $-x$ for x in $\frac{1}{1-x}$
- ▶ $\frac{1}{1+x^2}$ by replacing $-x^2$ for x in $\frac{1}{1-x}$
- ▶ $\frac{1}{(1-x)^2}$ by differentiating $\frac{1}{1-x}$
- ▶ $-\ln|1-x|$ by integrating $\frac{1}{1-x}$
- ▶ $\arctan x$ by integrating $\frac{1}{1+x^2}$
- ▶ $\ln|1+x|$ by integrating $\frac{1}{1+x}$
- ▶ $\frac{x^2}{(1+x)^3}$ by differentiating $\frac{1}{1+x}$ twice and then multiplying by x^2 .
